

## **Whole House Iron/ Hydrogen Sulfide Reduction Filter**

### **Item #607**

**If** your home's water supply has high iron, manganese or hydrogen sulphide contents, you should consider the addition of a whole house iron/hydrogen sulphide reduction filter to your water treatment system.

This filter contains manganese greensand which reduced these contaminants through an oxidation/ filtration process, thereby substantially improving water clarity, taste and odours, while at the same time protecting your plumbing system including toilets, baths, tubs, shower and appliances such as clothes washer and dishwashers from unsightly staining. It adds no harmful chemicals to water, making it completely safe for drinking water applications.

Iron and Manganese reduction will also prolong the life of a reverse osmosis membrane or any other purification systems.

This filter should be installed right after the pressure tank, on your cold water line. For best results pre-sediment filter and post filter is recommended.

When the water flow from your faucet or shower in the house gets reduced, check which filter needs to be replaced by running the empty housing, before changing over. Your savings per year will be substantial.

The life of the filter depends on the contamination level and the amount of water consumed on a daily basis.

Enjoy!
